

ABSTRACT OF THE DISCLOSURE

A diaphragm operated water pressure regulator switchable between an operating mode and a flushing mode by changing the relative positions of the water inlet port and the valve in the regulator. By moving the port to a position in which the valve cannot close the inlet port, water at full line pressure enters the watering system to flush the system. A mounting bracket is also disclosed which independently suspends the regulator and a support pipe from a cable in the poultry house such that the regulator can be removed from the watering system without affecting the support pipe.
